UCLA

Lexical Stress and Syllable Weight in Hindi-Urdu Pop Text-Setting

Muhammad Rehan, Dhanya Charan, and Jahnavi Narkar
{rehanmuh, dhanya, jnarkar}@ucla.edu

LSA Annual Meeting, January 8-11, New Orleans

Lexical stress in Hindi-Urdu

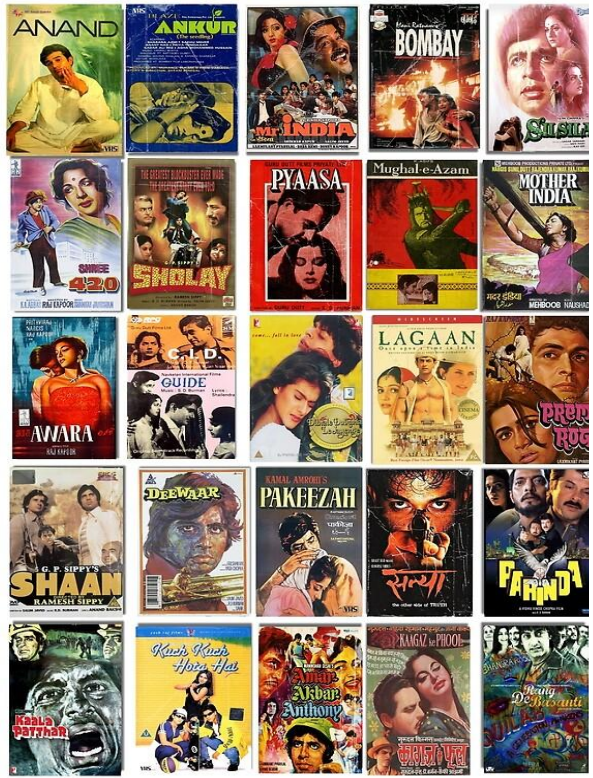
Author	Lexical stress?
Féry (2010)	No
Harnsberger (1996)	No
M. Ohala (1999, 1994, 1991, 1977)	No
Mehrotra (1965)	Yes
Pandey (1989, 2021)	Yes
Hussain (1997)	Yes
Nair (1998, 1999)	Yes
Mumtaz, Bögel, Butt (2020)	Yes

Problems with earlier studies

- Extremely low sample sizes
- Elicitation of data in (preverbal) focus position
- Lack of controls for L1/L2 background

A new data source: Bollywood pop music

- Pop music and natural speech rhythm
- Text-setting in pop music to investigate lexical stress (Nichols et al. 2009, Zuraw and Roca 2025, Zuraw and Ahn forthcoming)
- Rich tradition of pop music in Hindi-Urdu



Text-setting as a window into phonology

- How to set lyrics to music?
- Native speaker text-setting intuitions based on phonological grammars (e.g., Allen 1973:13, Hayes 2009, Rodríguez-Vázquez 2010, Kiparsky 2020, Temperley 2022, Moreno and Bariş 2022).

Text-setting

Correspondence between linguistic structures and music (cf. Dell & Halle 2009, Proto 2013, Temperley and Temperley 2013, McPherson 2020, Ryan 2022):

- Tone
- Duration
- Prominence
- Constituency

Focus of this study

- **Duration matching**: Aligning heavier syllables with longer beats
- **Prominence matching**: Aligning stressed syllables with musically prominent events (on-beats)

Text-setting in Hindi/Urdu

Fairbanks 1981, 1987a, 1987b:

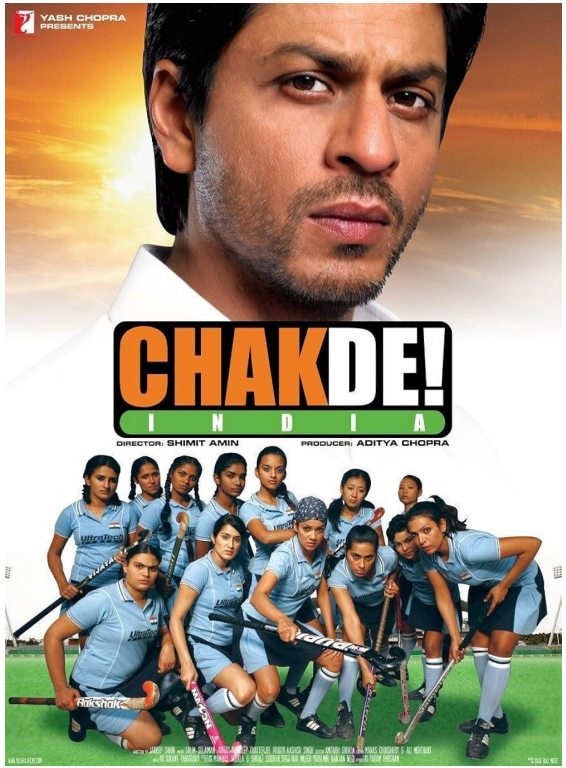
- Putatively stressed syllables more likely be to set to more prominent metrical positions of the verse lines.

- Problems:
  - Preponderance of archaic Sanskritized vocabulary
  - Composed in older Medieval-period meters

Data

Songs list

Choli Ke Peeche	Deewangi Deewangi
Ishq Jaisa Kuch	Jaane Kyun
Heeriye	Nagada Sang Dhol
Tere Naina	Zindagi Ek Safar
Uska Hi Banana	Saare Jahan
Senorita	Chak De India
Awara Hoon	Kabira
Meri Laila	Raataan Lambiyaan



Converting sheet music to spreadsheets

beat		1	1.25	1.5	1.75	2	2.25	2.5	2.75	3	3.25	3.5	3.75	4	4.25	4.5	4.75

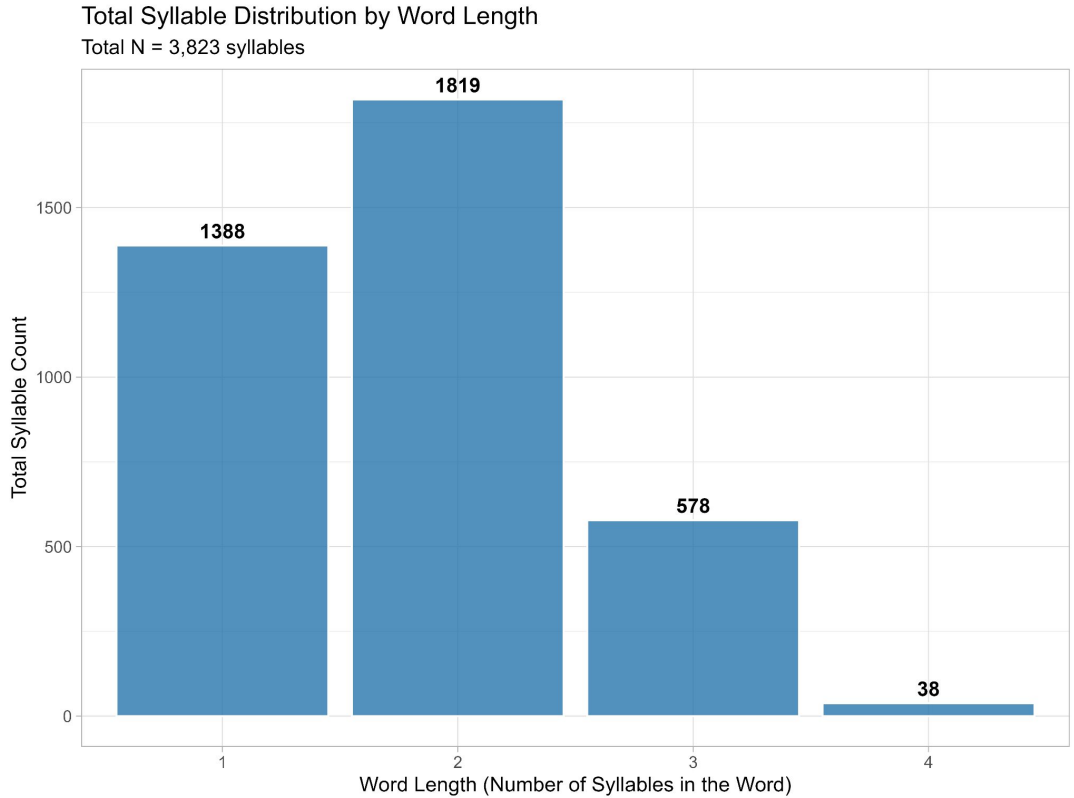
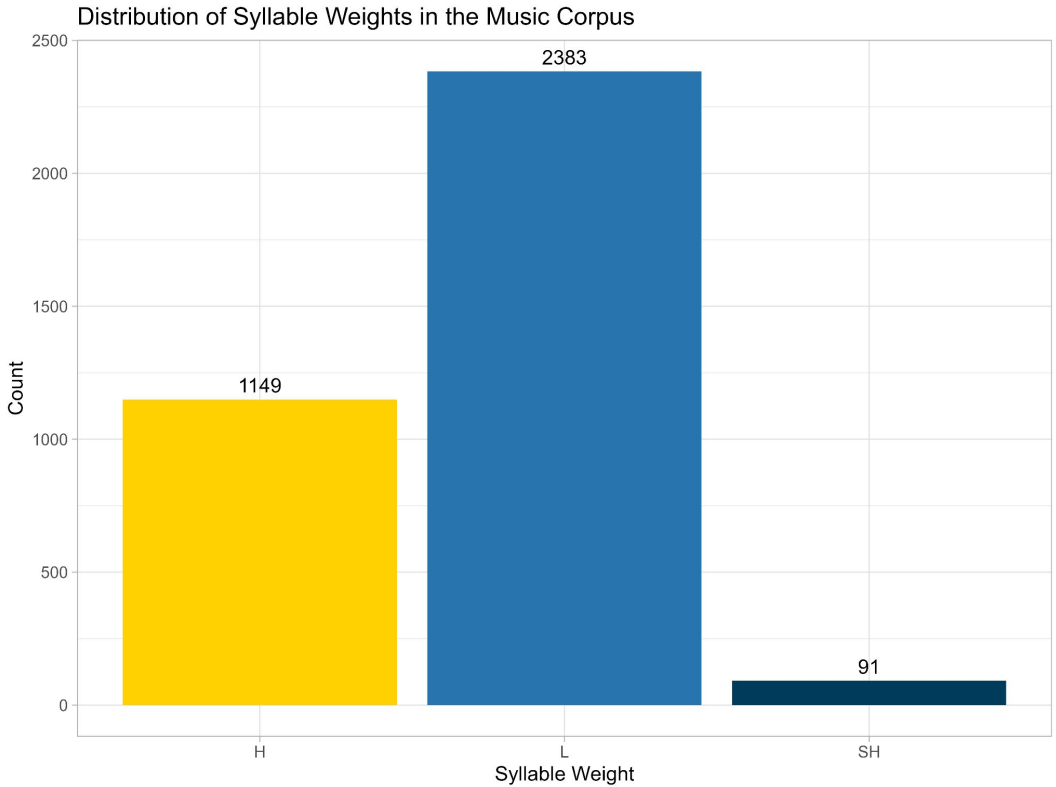
Data Exclusion

- Melismatic settings
- Syllables set to longer than four beats
- Onomatopoeic words
- Syncopated beats

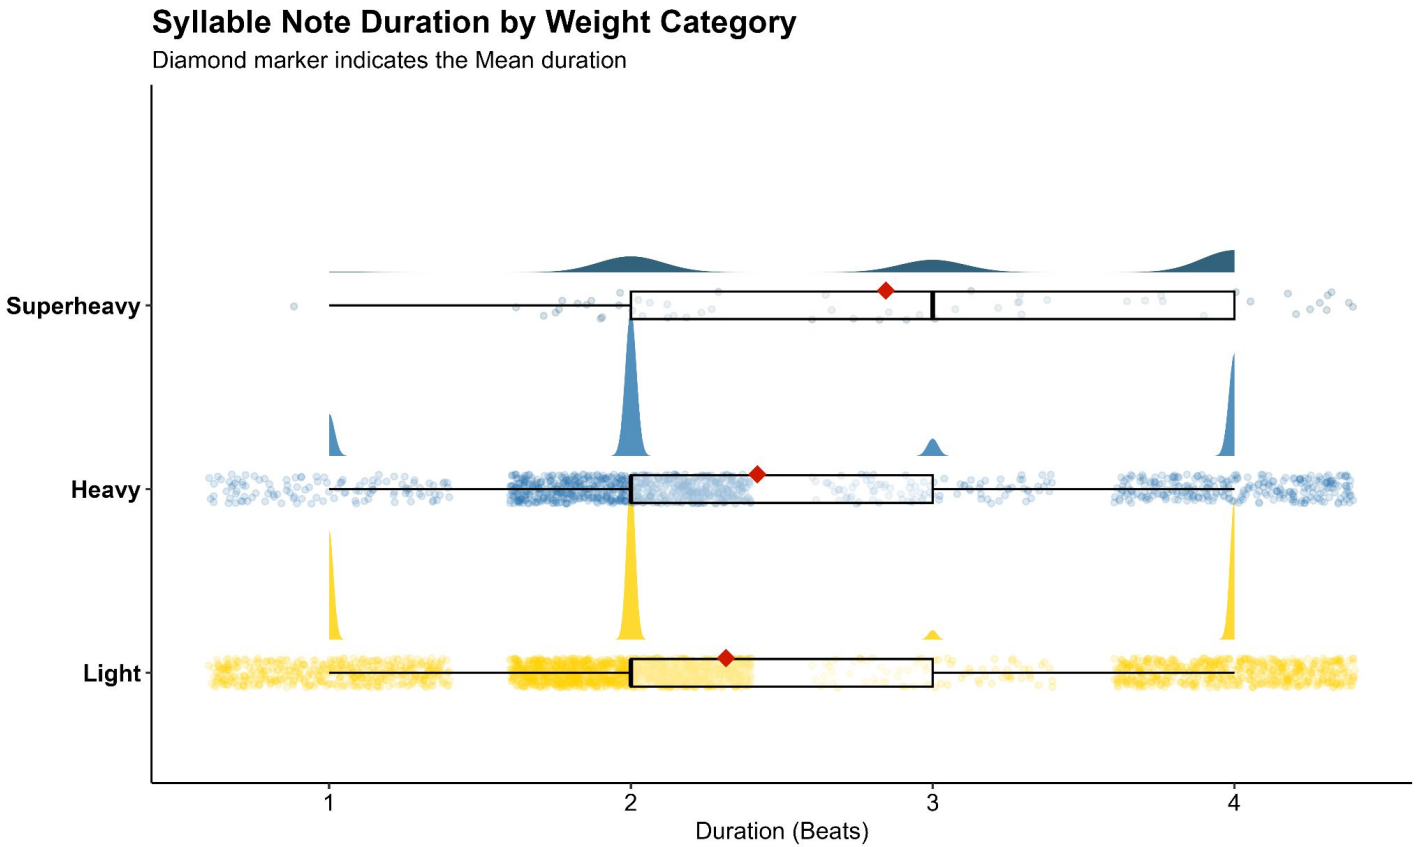
Word sizes at a glance



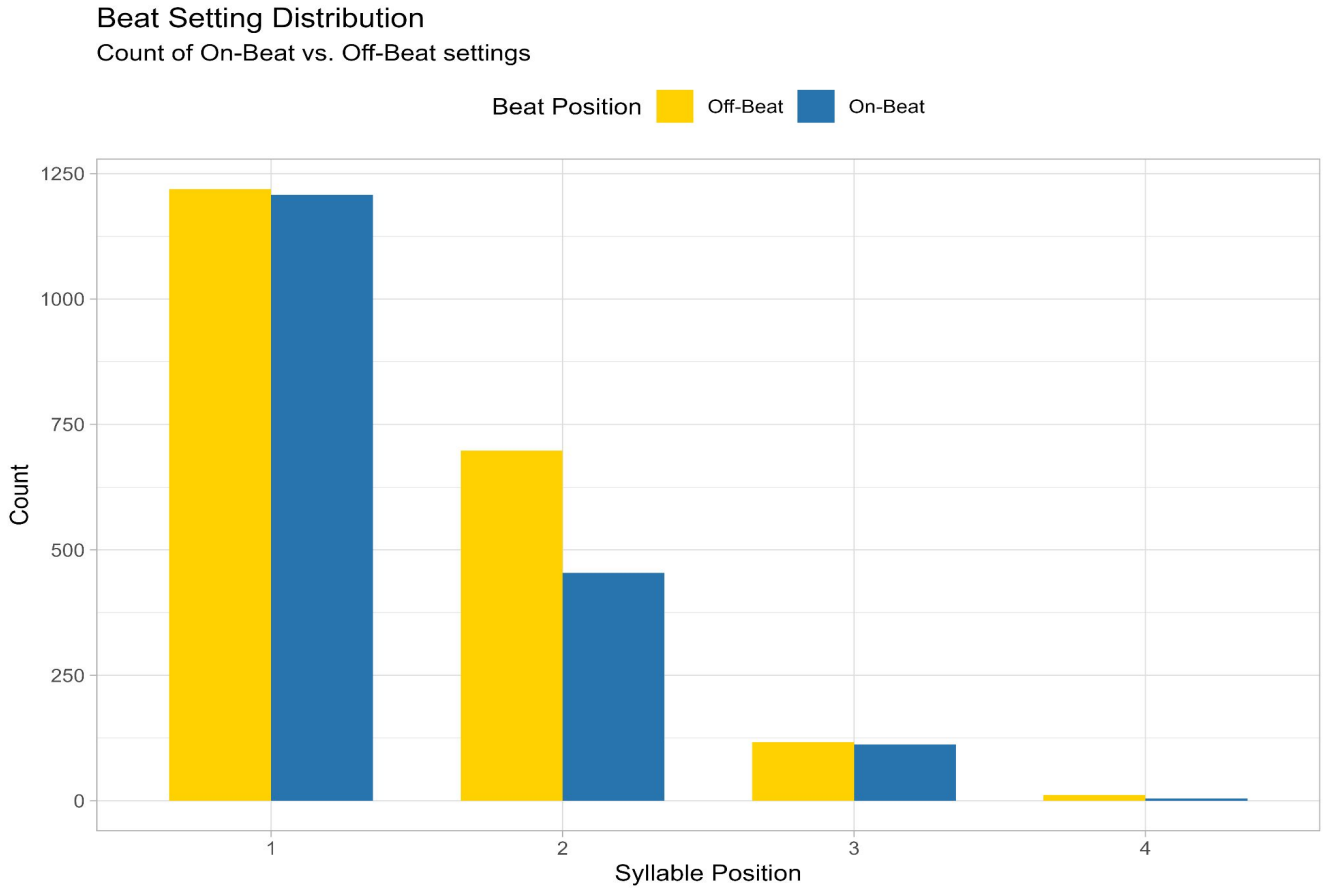
Syllable weight at a glance



Distribution of syllabic beat durations



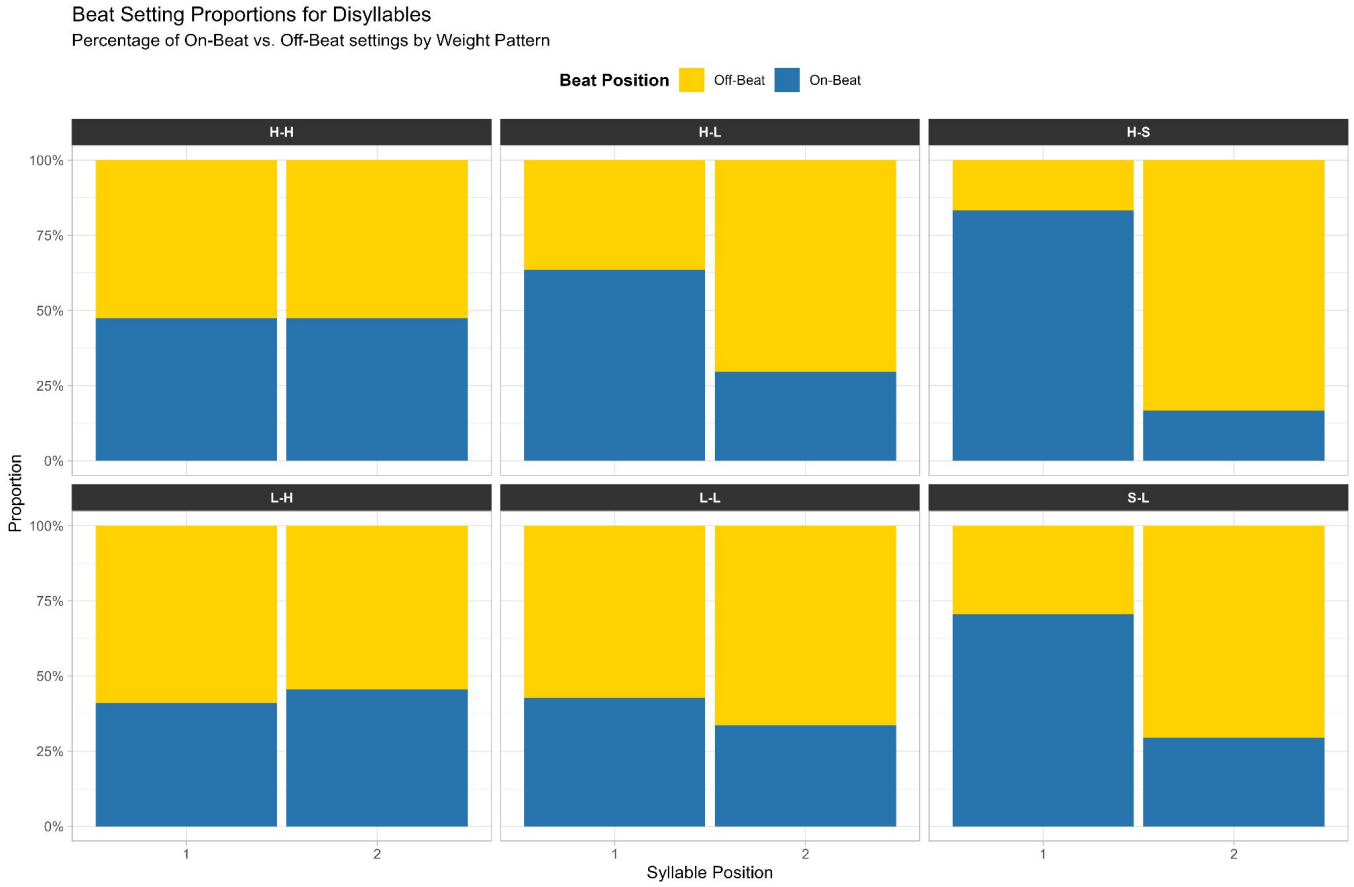
Distribution of syllabic beat alignment



Claims about the distribution of stress in disyllabic words

Word Type	Stress Pattern (e.g., Pandey 1989, 2021; Hayes 1995)
LL	ˈLH
HL	ˈHL
LH	LˈH
LS (S = superheavy)	LˈS
SL	ˈSL
SH	ˈSH

Distribution of beat alignment for disyllables



Methods and results

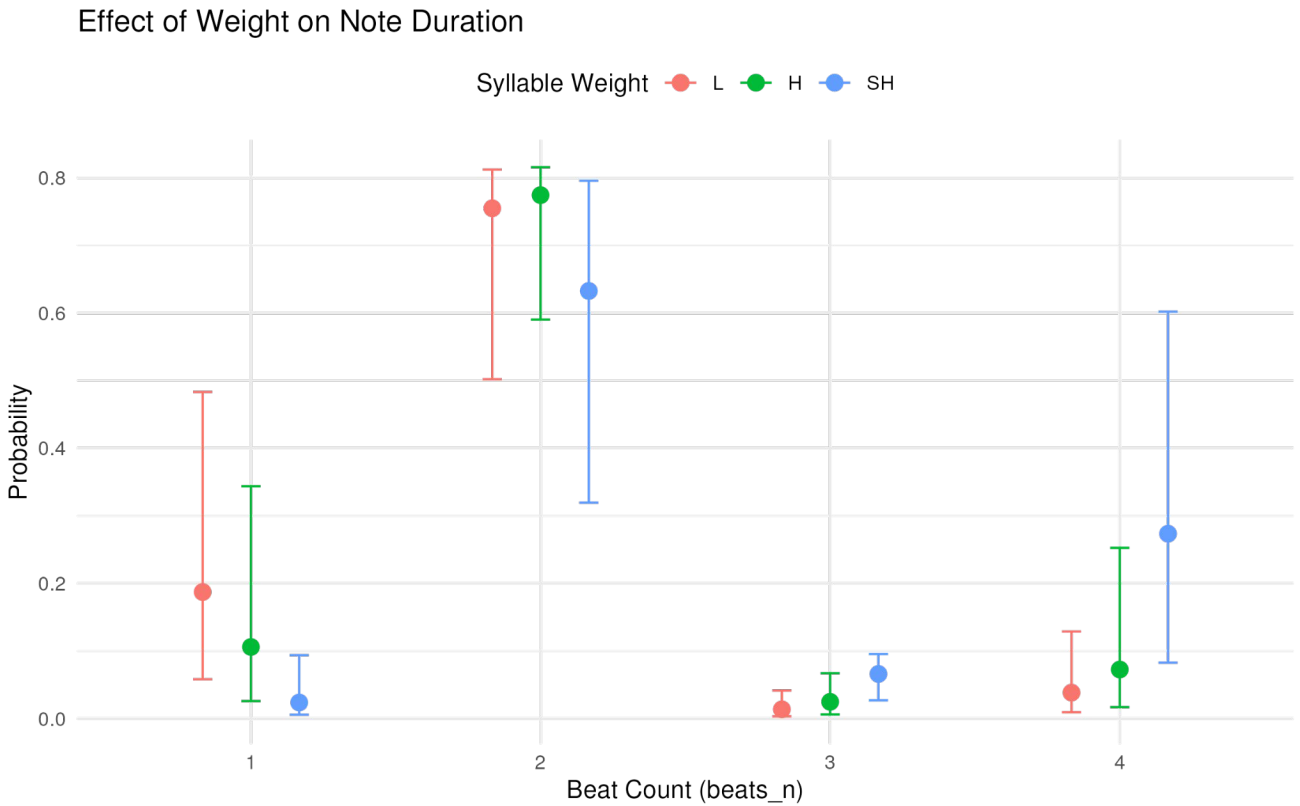
Hypotheses to test

- Are putatively stressed syllables more likely to be set to on-beats?
- Are putatively stressed syllables set to longer beat intervals compared to their unstressed counterparts?
- How we are coding for “putative stress”?
    - Agreement on the stress of bisyllabic words and disagreement on almost everything else.
    - Test for only bisyllabic words here

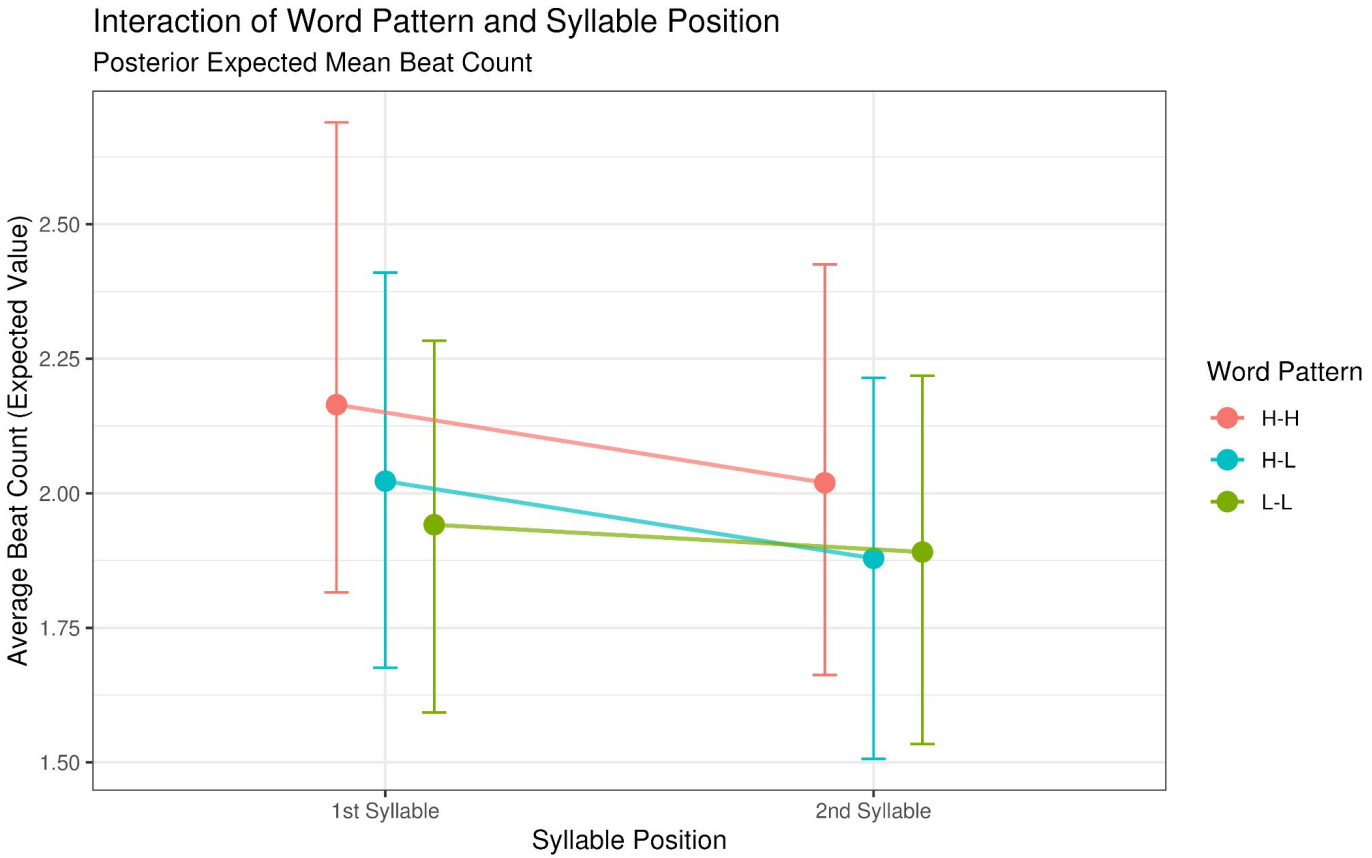
Logistic regression for syllable beat settings

- Log-odds of on-beats setting given some predictors
- log ((p = on-beats) / 1 - (p = on-beats))
- Dependent variable:
  - on-beats or off-beat? (1/0)
- Predictor variables:
  - Syllable weight (Fixed effect)
  - Syllable position (Fixed Effect)
  - Word Length (Fixed effect)
  - Phrase-finality (Fixed effect)
  - Word (Varying effect)
  - Song (Varying effect)

Effect of syllable weight on note duration of disyllabic words



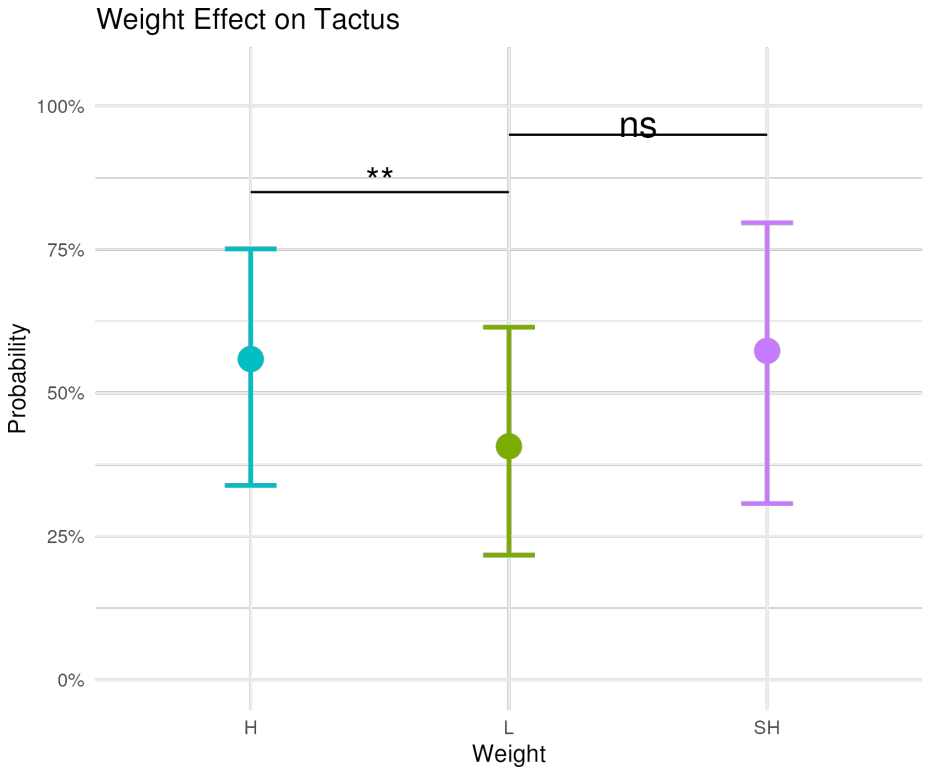
Effect of putatively stressed syllables on note duration



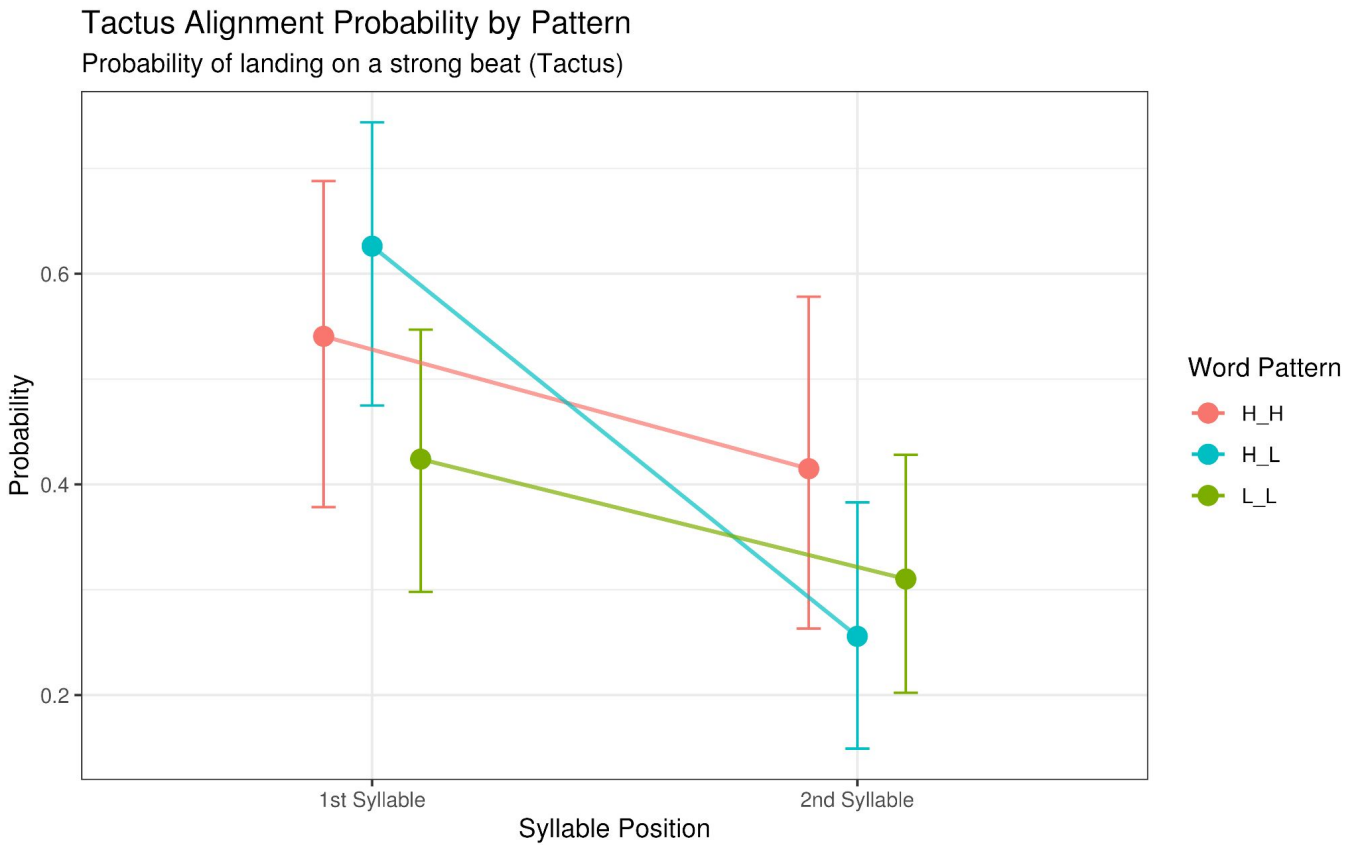
Ordered logistic regression for note durations

- More than two categories of the dependent variable (1–4 notes)
- Sequential order (4 notes > 3 notes > 2 notes > 1 note)
- True scale unknown (how longer are 4 notes than 3 notes?)
- Dependent variable:
  - Total notes a syllable is set to
- Predictor variables:
  - Syllable weight (Fixed effect)
  - Word Length (Fixed effect)
  - Phrase-finality (Fixed effect)
  - Word (Varying effect)
  - Song (Varying effect)

Effect of syllable duration on beat alignment



Effect of putatively stressed syllables on beat alignment



Conclusions

- Effects of duration matching does not seem to be present in Hindi-Urdu pop text-settings.
    - Syllable alignment: (Super)Heavy syllables alleged to be stressed are not set to longer beats.
- Very weak evidence for lexical stress: Hindi-Urdu pop music reveals that putatively stressed syllables are more likely to be aligned to on-beats.
- In text-setting, stress is encoded only in beat alignment and not note duration in Hindi-Urdu pop music (cf. Zuraw and Ahn forthcoming for Korean).

Future directions

- Extend the corpus and include rap music
- Code for melodic peaks to investigate lexical stress and its relationship with pitch movements in music.
- Incorporate acoustic evidence from experiments
- Perform a meta-analysis of experimental data

Thank You

We would like to extend our deepest gratitude to Kie Zuraw, Megha Sundara, John McGahay, and to the members of the UCLA Global Pop Music seminar and the UCLA Phonology seminar.
